engineers statics 5th pdf -

In classical mechanics, impulse (symbolized by J or Imp) is the integral of a force, F , over the time interval, t , for which it acts. Since force is a vector quantity, impulse is also a vector in the same direction. Impulse applied to an object produces an equivalent vector change in its linear momentum, also in the same direction. The SI unit of impulse is the newton second ($\text{N}\cdot\text{s}$), and the ... Impulse (physics) - Wikipedia - In physics, acceleration is the rate of change of velocity of an object with respect to time. An object's acceleration is the net result of all forces acting on the object, as described by Newton's Second Law. The SI unit for acceleration is metre per second squared (m s^{-2}). Accelerations are vector quantities (they have magnitude and direction) and add according to the parallelogram law.
